

TP4 - Use Case Diagram

1. System Actors

- **Hotel Client:** Makes reservations (phone, web, or mobile app), completes online CIB card payments when required, orders extra services (breakfast, lunch, dinner), and settles final payments.
- **Receptionist:** Searches available rooms, verifies reservations, performs check-ins, creates stays/invoices, performs check-outs, and receives payments.
- **Cashier:** Records additional client consumptions (meals/services) into the system during their stay.
- **Housekeeping Staff:** Cleans rooms marked as "dirty free" and updates their status to "clean awaiting".
- **Floor Manager:** Inspects rooms, updates statuses to "available" if clean, or marks them as "unavailable" if damages are found.
- **Maintenance Staff:** Repairs damaged/unavailable rooms and restores them to functional status.
- **Bank Server (External System Actor):** Authorizes and validates online CIB card payments over SSL connections.

2. Actions Occurring Outside the System

- **Making a Phone Call:** A client placing a telephone call to request a reservation (the phone call itself happens externally; entering the booking data into the system happens inside).
- **Physical Travel & Arrival/Departure:** The client traveling to or leaving the hotel premises.
- **Physical Meal Consumption:** The client ordering and eating breakfast, lunch, or dinner in the restaurant or room.
- **Physical Room Cleaning:** Housekeeping staff manually sweeping, washing, and preparing hotel rooms.
- **Physical Room Inspection:** The floor manager physically walking through the room to test amenities and check cleanliness.
- **Physical Maintenance Work:** Technicians performing physical repairs (fixing air conditioning units, plumbing leaks, electrical issues).

3. Functional System Boundaries (Modules)

1. **Reservation Module:** Manages multi-channel bookings (phone/web/app) and handles SSL-secured bank verification for CIB card payments (> 5000 DH threshold).
2. **Billing & Reception Module:** Handles room searches, reservation verification, client check-ins, stay creation, and check-outs. Generates stay invoices, automatically

posts meal/service charges recorded by cashiers, and handles final billing settlement.

3. **Housekeeping Module:** Tracks rooms with "dirty free" status and allows cleaning staff to update status to "clean awaiting"
4. **Maintenance Module:** Enables floor managers to verify cleanliness ("available") or flag broken rooms ("unavailable"), and allows maintenance staff to log repairs.
